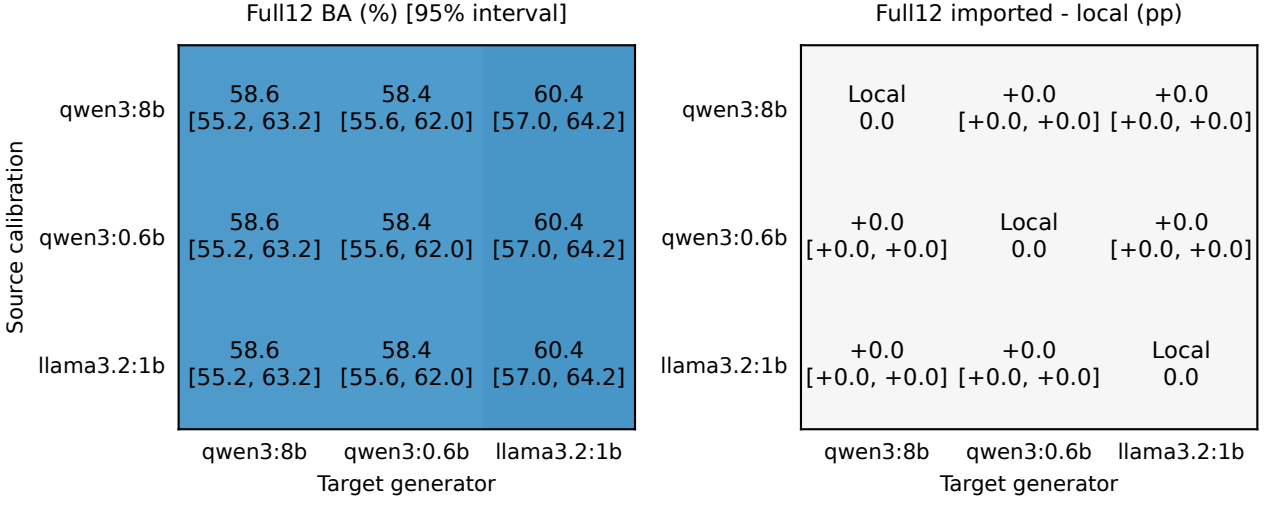
POST-INTERRUPTION RECOVERY | Per-chunk buckets

Default setting; rows = source calibration, columns = target generator.



Qwen 8B fixed-cell point 2 is a post hoc repeated arm; the original session is missing.
Left: absolute Full12 intervals. Right: frozen analyzer paired differences and paired intervals.
Deltas are not obtained by subtracting absolute CI bounds; local diagonal is an identity reference.
Conditional on fitted attacks and finite topics; calibration transfer, not attacker-model transfer.
